IN THE CLAIMS

1. (Amended) A laminate film, comprising:

a) a first resin layer comprising a polyolefin resin and having a surface treated by a discharge treatment method that imparts excellent printability to the treated surface; and

b) a mixed resin layer comprising a polyolefin resin formed on and adhered to a surface of said first resin layer opposite the treated surface having said surface treatment,

wherein the first resin layer and the mixed resin layer each contain up to 800 ppm fatty amides comprising stearamide or erucamide and the mixed resin layer contains a first additive material comprising at least one crosslinked silicone polymer in an amount of about 0.1% - 0.5% by weight of the mixed resin layer and/or at least one silicone oil in an amount of about 0.02% - 0.2% by weight of the mixed resin layer, and a second additive material comprising at least one amorphous aluminosilicate in an amount of about 0.10 - 0.50% by weight of the mixed resin layer.

2. (Amended) The laminate film according to claim 1, wherein said first resin layer has a thickness of about 6 - 40 μm.

3. (Amended) The laminate film according to claim 1 or 2, wherein said first resin layer consists essentially of a polypropylene resin.

4. (Amended) The laminate film according to claim 1 or 2, wherein said mixed resin layer has a thickness of about 0.2 - 5.0 μm.

5. (Amended) The laminate film according to claim 1 or 2, wherein said mixed resin layer consists essentially of a polypropylene resin.

6. (Amended) The laminate film according to claim 1, wherein at least one component of said first additive material is a crosslinked silicone resin having a spherical average particle size of 2 - 5 μm, a specific gravity of 1.32 at 25°F, a bulk density of 0.15 - 0.50, and a linseed oil

absorption rate of 50 - 90 ml/100g or is a silicone oil having viscosity of 300 - 400 cSt., specific gravity at 77°F of 0.90 - 0.99, and volatile content of 0.001 - 0.005%.

7. (Twice Amended) The laminate film according to claim 1, further comprising an anti-block material which is an amorphous sodium calcium aluminosilicate having a particle size of 2 - 5 μm and a bulk density of 0.30 - 0.80 g/cm^3 or an amorphous aluminosilicate having a particle size of 2 - 5 μm and a bulk density of 0.10 - 0.30 g/cm^3.

8. (Amended) The laminate film according to claim 1, wherein at least one component of said second additive material is an amorphous sodium calcium aluminosilicate having a particle size of 2 - 5 μm and a bulk density of 0.30 - 0.80 g/cm^3; or an amorphous aluminosilicate having a particle size of 2 - 5 μm and a bulk density of 0.10 - 0.30 g/cm^3.

Add new claims 9 and 10, as follows:

9. The laminate film according to claim 1 or 2, wherein the polyolefin resin of the first resin layer consists essentially of a polypropylene homopolymer.

10. The laminate film according to claim 1 or 2, wherein the polyolefin resin of the mixed resin layer consists essentially of a polypropylene homopolymer.
